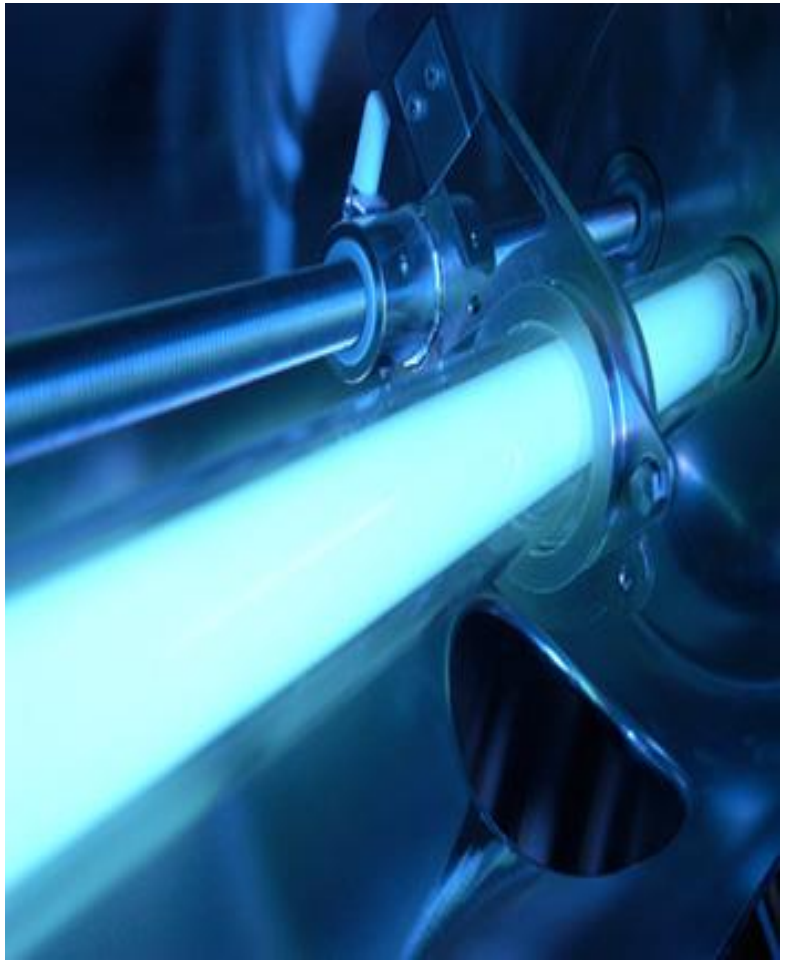
ULTRAVIOLET CROSSLINKING

A COST EFFECTIVE ALTERNATIVE TO E-BEAM CROSSLINKING OF PE AND HFFR

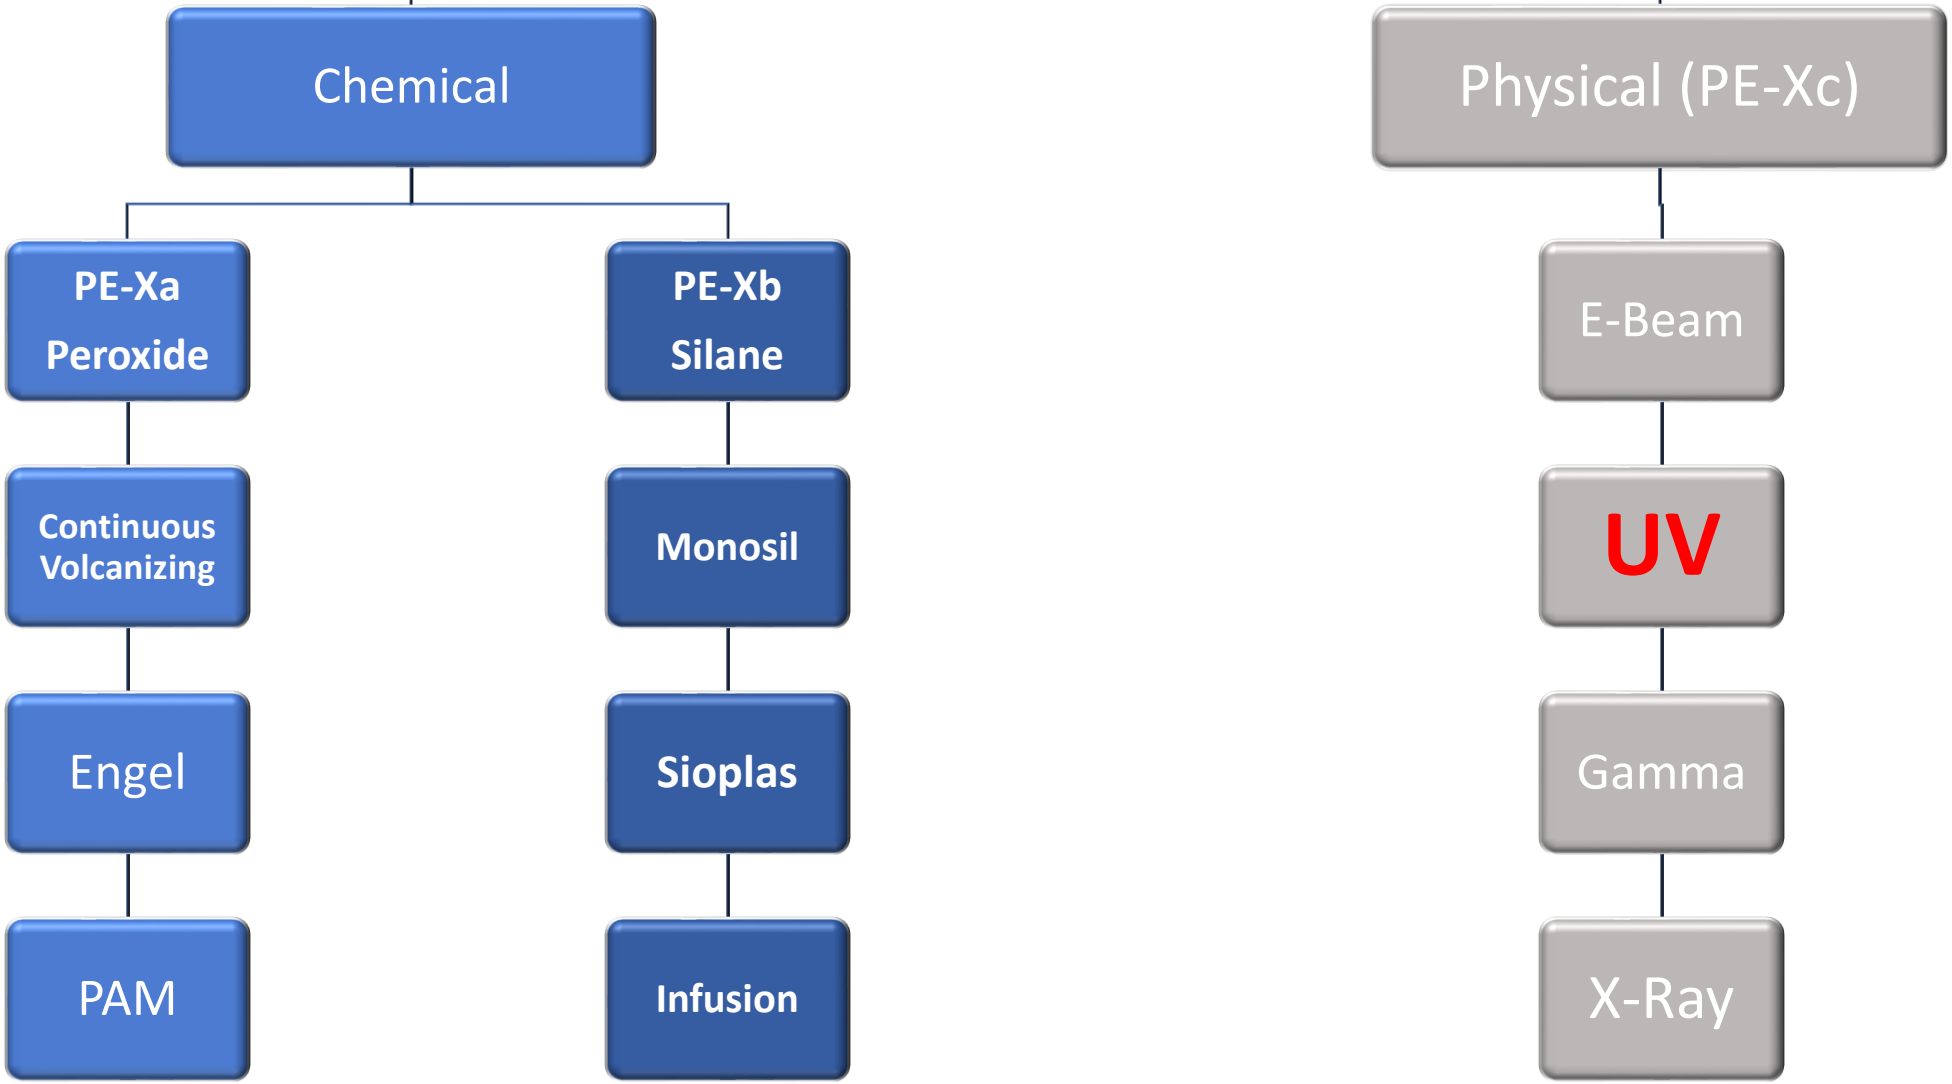


Maurice Alphonso

Technical Director

AMI “Polymer in Cables” Conference 14 - 16 September 2021

PE Crosslinking methods



Chemical Crosslinked cables: what crosses your mind?

PLEXCHEM Technologies
Chemistry for Good

- Pre-crosslinking - *lumpy surface*
- Punctures - *cable failures*
- Under-crosslinking - *poor hot set*
- Shrinkage - *choosing the right tools*
- Orange Skin - *unacceptable appearance*
- The outcome of extrusion - *finding out too late*
- Operating conditions - *leading to poor test results*
- Special storage conditions - *Shelf life*

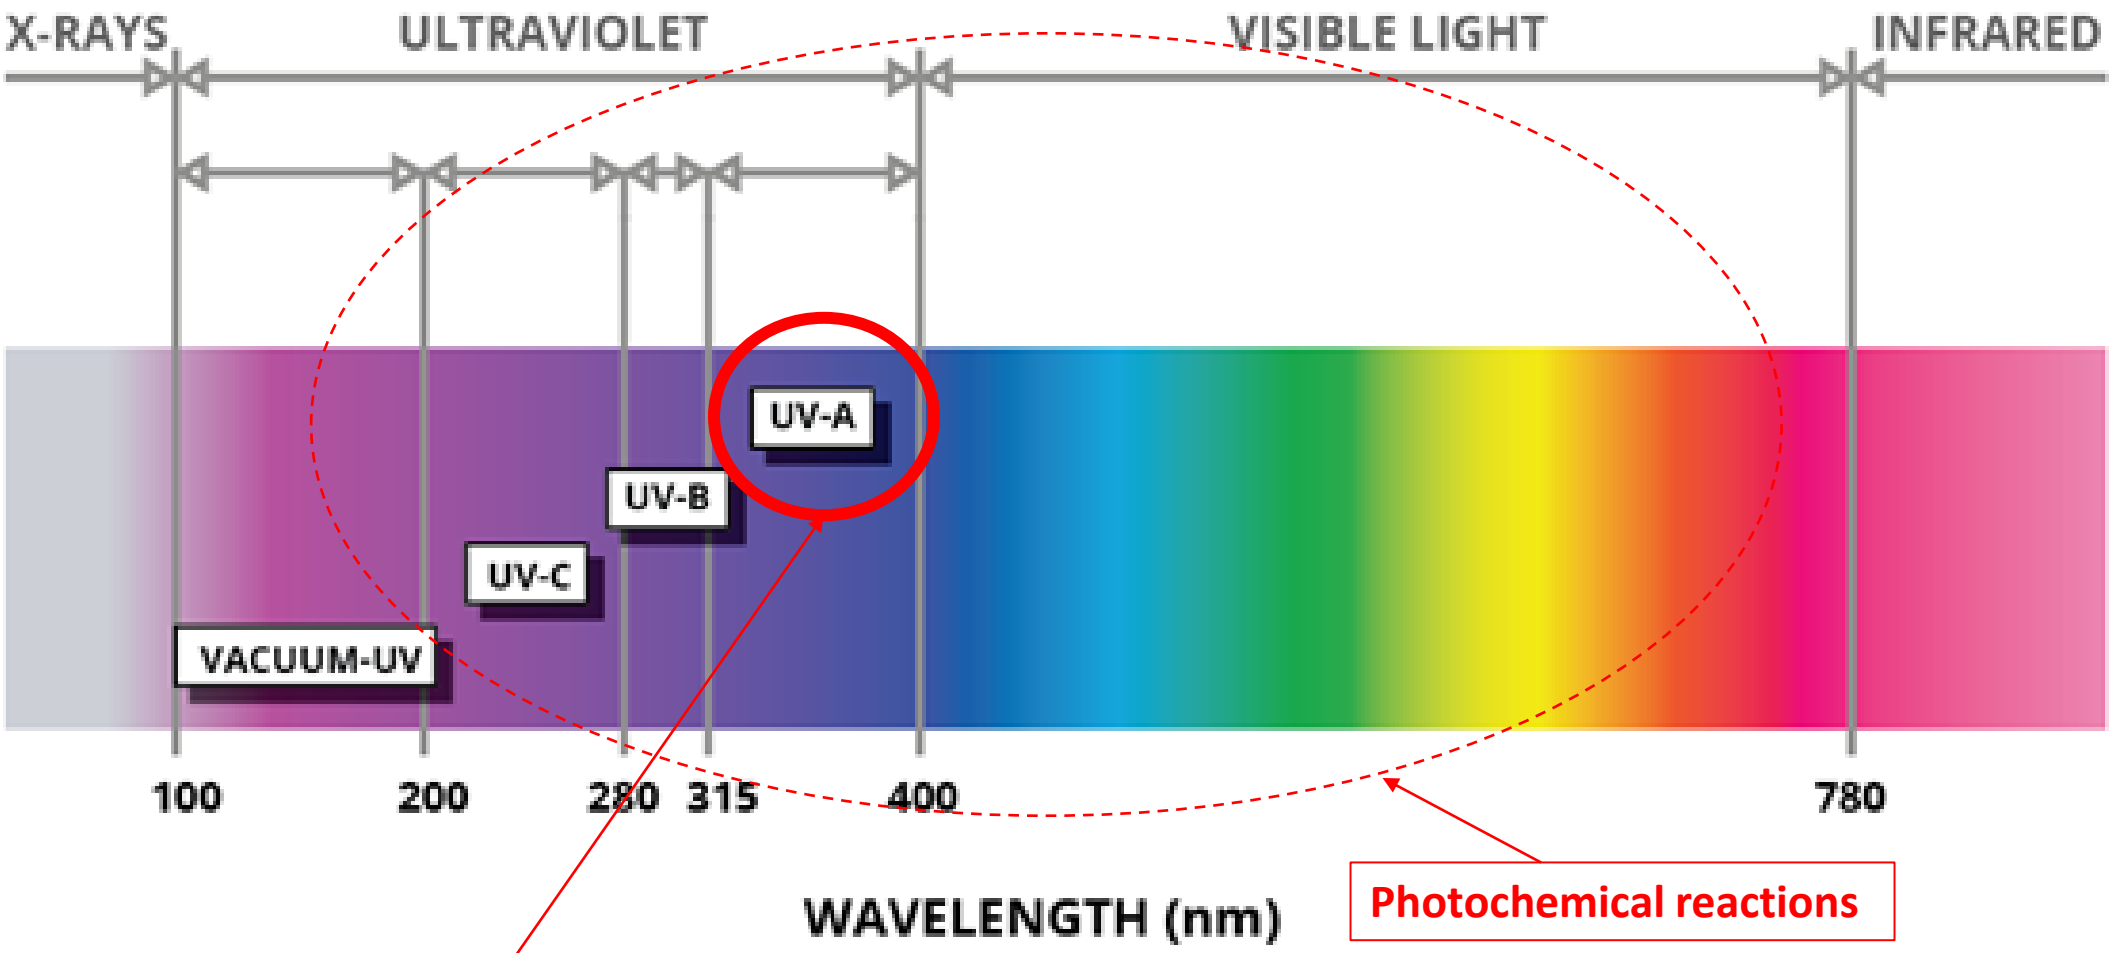
Because the crosslink chemicals interfere with the extrusion process

An introduction to Photochemistry

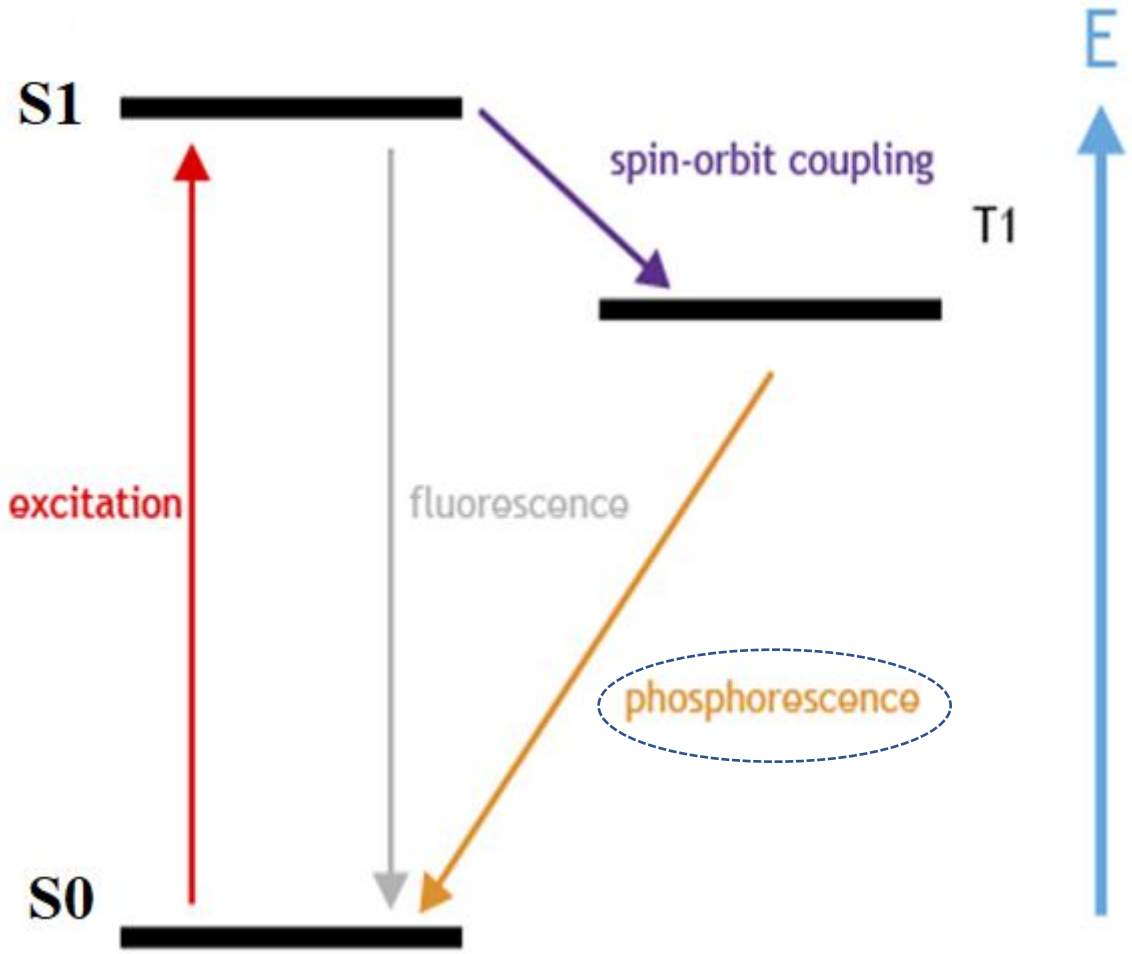
PLEXCHEM Technologies
Chemistry for Good

The study of chemical reactions and physical behaviour that may occur under the influence of visible and/or ultraviolet light is called **Photochemistry**

Electromagnetic Spectrum



Phosphorescence



Examples of Phosphorescence

Glow in the dark stick

signage

Amount of Time for Interactions

PLEXCHEM Technologies

Process	Transition	Timescale (sec)
Light Absorption (Excitation)	$S_0 \rightarrow S_n$	10^{-15} (instantaneous)
Internal Conversion	$S_n \rightarrow S_1$	10^{-14} to 10^{-11}
Vibrational Relaxation	$S_n^* \rightarrow S_n$	10^{-12} to 10^{-10}
Intersystem Crossing	$S_1 \rightarrow T_1$	10^{-11} to 10^{-6}
Fluorescence	$S_1 \rightarrow S_0$	10^{-9} to 10^{-6}
Phosphorescence*	**$T_1 \rightarrow S_0$**	**10^{-3} to 100**
Non-Radiative Decay**	$S_1 \rightarrow S_0$	10^{-7} to 10^{-5}
	$T_1 \rightarrow S_0$	10^{-3} to 100

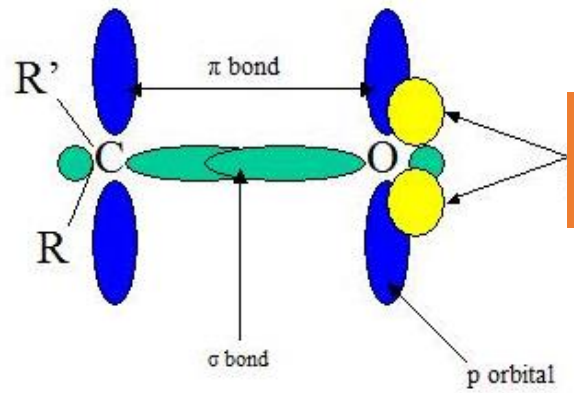
Just for perspective:

The time the insulation spends in 1 meter UV chamber at a speed of 300m/min is 0.2 sec, and in that time there would have been at least 10^6 interactions many resulting in crosslink reactions

**The singlet to triplet (or reverse) transition involves a change in electronic state. For this reason, the lifetime of the triplet state is longer the singlet state and this allows the unpair electron to undergo chemical reactions*

*Non-radiative decay** may take place by intermolecular energy transfer to a different molecule in a process called **quenching***

Summary of the process



Lone pairs or non-bonded pair

2nd step; Free radical generation with Carbon monoxide formation

Ketone e.g. Benzophenone

UV radiation

3rd step; Free radical extraction of Hydrogen atom to produce polymeric free radicals

4th step; Polymeric free radical combine to form crosslink chains

PLEXCHEM Technologies

How is chemical and radiation crosslinking similar?

-Both require the formation of free radicals that extract hydrogen atoms from polymers to be crosslinked

-After hydrogen extraction, the polymeric free radicals will react with other polymers to form crosslink chains

Main UV crosslinking equipment

UV Radiator

Purpose: To provide the required amount (intensity) of the threshold frequency (UV radiation) that will promote Electrons to the anti bonding energy level (singlet & triplet) in order to produce free radicals that results in crosslinking reactions

Chiller

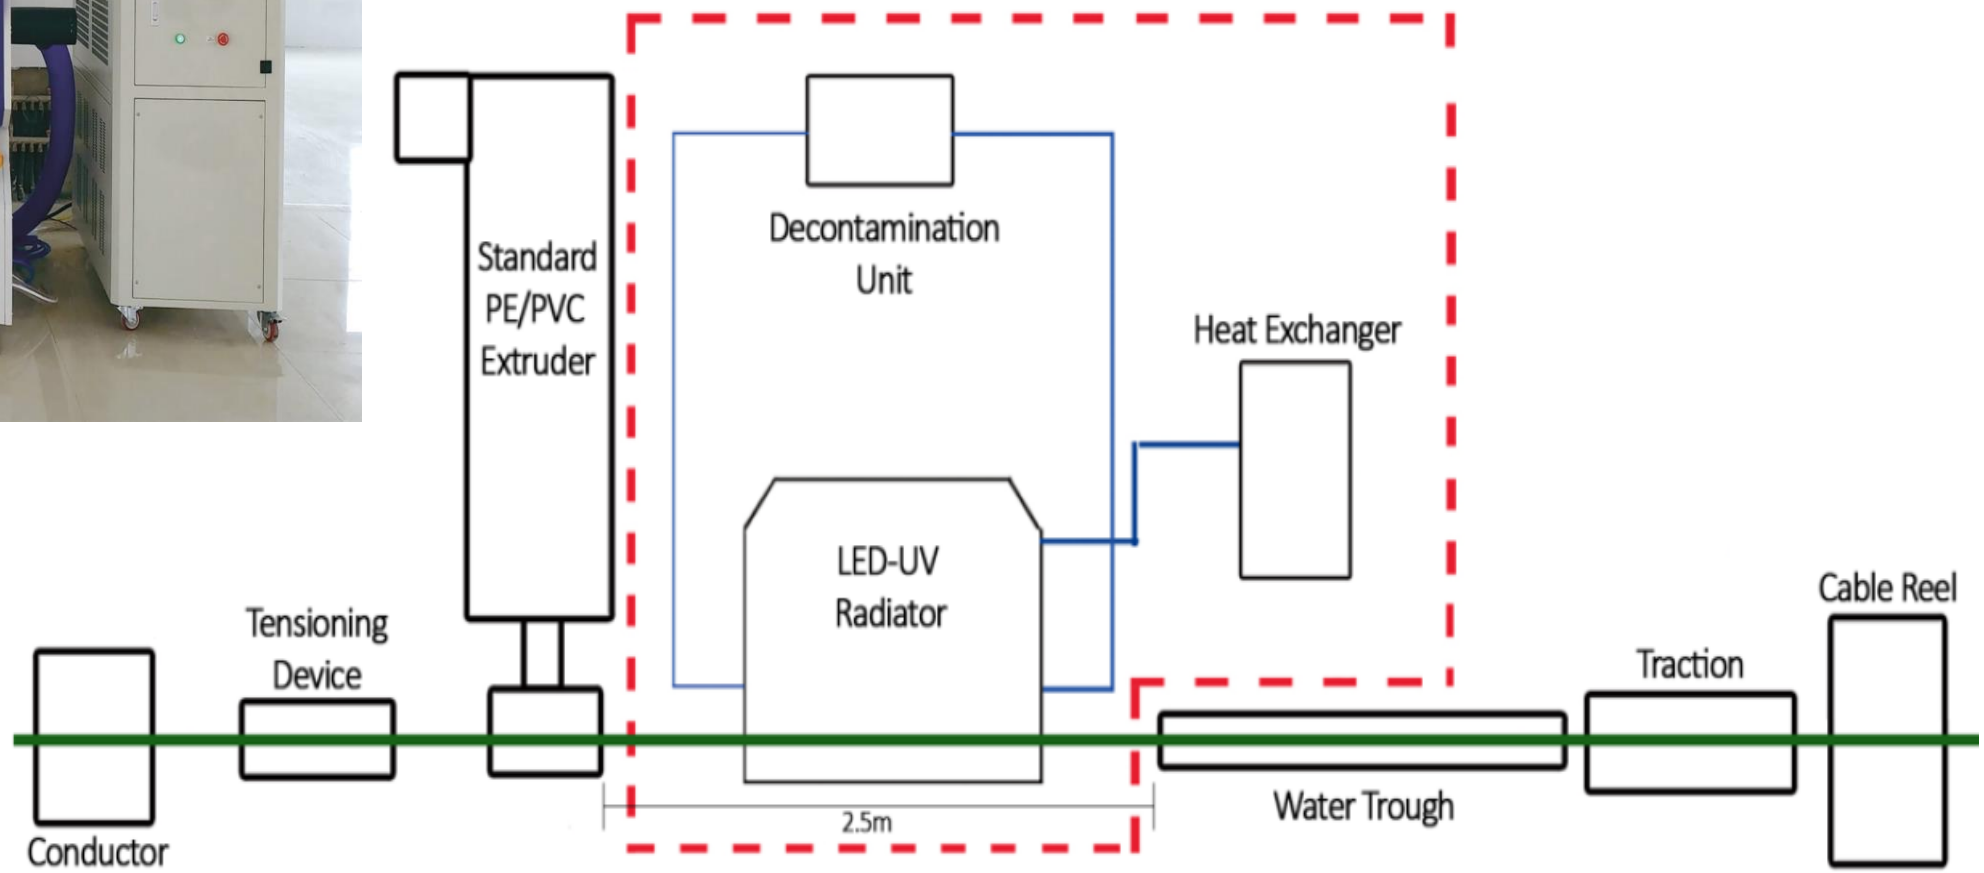
Purpose: The amount of heat generated would eventually lead to the damage of the LED lamps and the electronic components. It is imperative that the system be kept below 50° C.

Extractor

The excitation of electrons into free radicals would produce trace amount of toxic gases e.g. Ozone, Oxides of N2, Carbon Monoxide. Such gases are harmful to the operators as well as the equipment.

Equipment setup in Extruder Line

No special construction or renovation of existing layout



UV vs E-Beam - Physical method

Typical 2.5 MeV system

Cost : more than 1 Million USD

Also building cost should be added

Required Space

Land : 230 m2

Building height : 20m

Required Power

100 kW

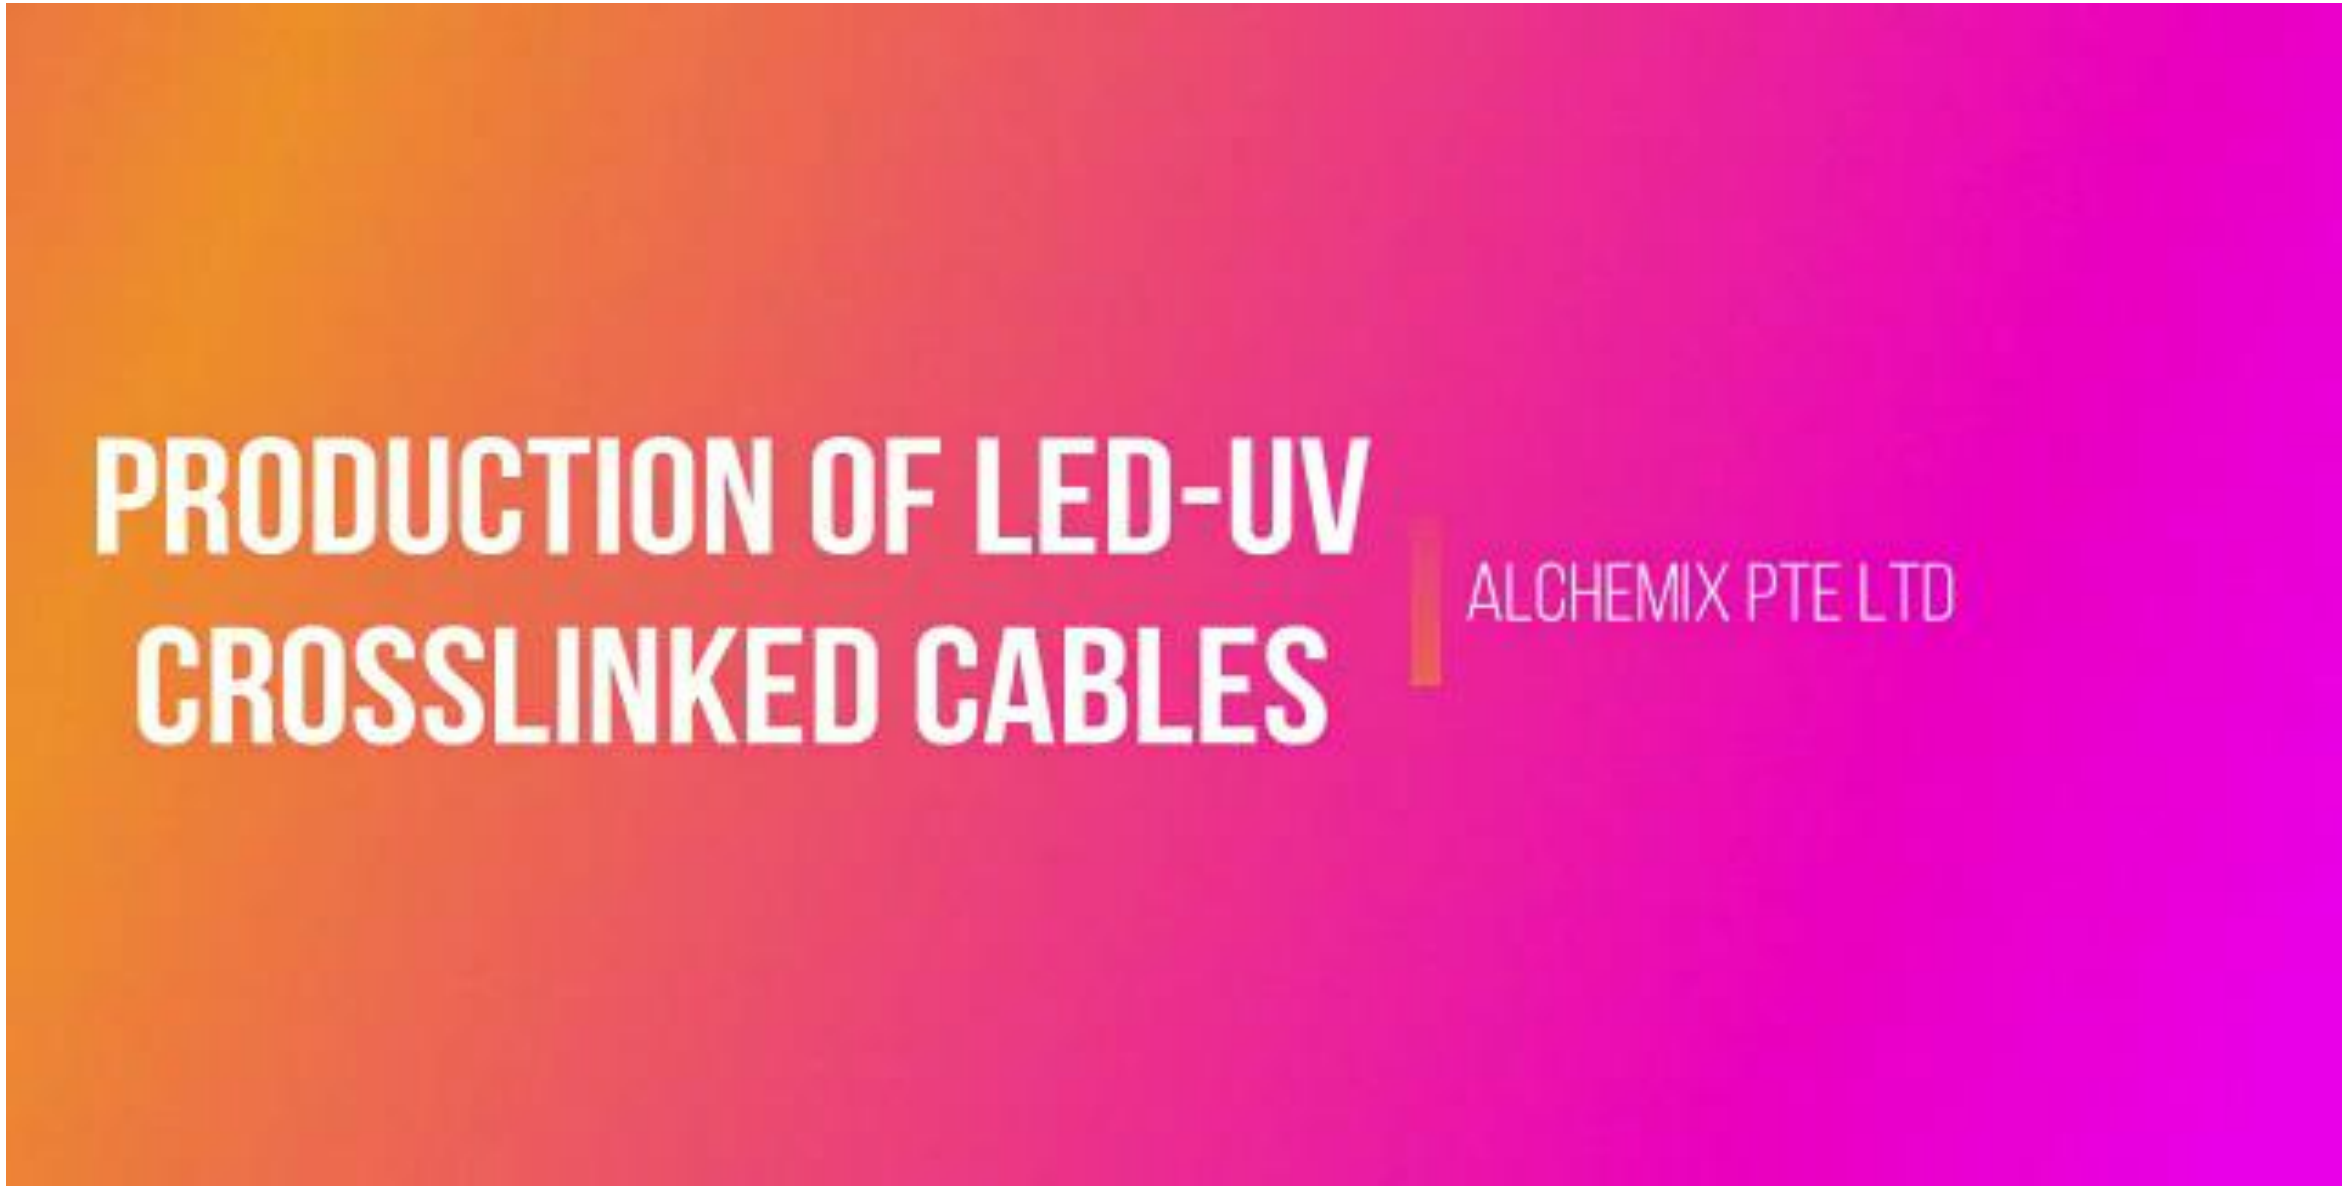
UV Crosslinking system

Cost : 60,000 USD

Required Space : 2.5 x 2 = 5 m2 ; Required Power : 20kW

PLEXCHEM Technologies

UV Equipment setup and run (Video)



Products made using UV crosslinking

- **Low voltage XLPE**
- **Low voltage highly filled crosslinked cables (using CaCO3) which is price competitive with PVC**
- **Medium Voltage Cables**
- **Crosslinked HFFR cables**
- **Using a masterbatch to make LV XLPE cables (recent innovation)**

UV crosslinked XLPE Type tests

Supplier	Plexchem Technologies Pte Ltd
Grade	UV LVXLPE 818C
Lot No	190421 MC-3
Purpose	Ageing Properties Improvement

The cable extrusion parameters listed below :

a) Cable size	: 6.0 mm² (copper)
b) Screw Speed	: 20.0 rpm
c) Line Speed	: 30 m/min
d) UV Power	: 70%
e) Melt Temperature	: 170°C - 180°C

1. Tensile strength and Elongation at Break (Before Ageing)

No. of specimens / Colors	Sample 1 / Natural	Sample 2 / Natural	Sample 3 / Natural
Tensile Strength (>12.5 N/mm²)	19.76	21.91	20.44
Elongation at Break (> 200%)	454	447	489

2. After ageing without conductor (135°C, 168 hours)

Tensile Strength (>12.5 N/mm²)	22.81	22.55	21.19
Max. Variation ± 25%	15.44	2.92	3.67
Elongation at Break (> 200%)	441	420	486
Max. Variation ± 25%	-2.86	-6.04	-0.61

3. After ageing with conductor (150°C, 168 hours)

Tensile Strength (>12.5 N/mm²)	20.01	19.71	19.93
Max. Variation ± 30%	1.27	-10.04	-2.50
Elongation at Break (> 200%)	408	419	454
Max. Variation ± 30%	-10.13	-6.26	-7.16

...Type tests

4. Hot Set and Shrinkage Test

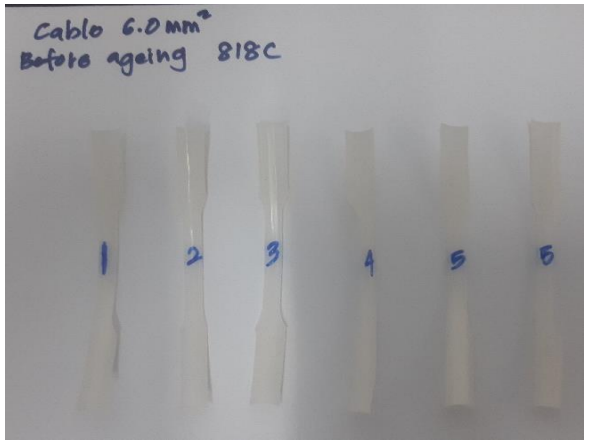
Shrinkage (< 4 %)	0	0	0
Hot set (Under Load < 175 %)	85	70	90
Permanent Set (Cooling < 15 %)	5	0	0

5. Bending Test After Ageing(150°C, 240 hours)

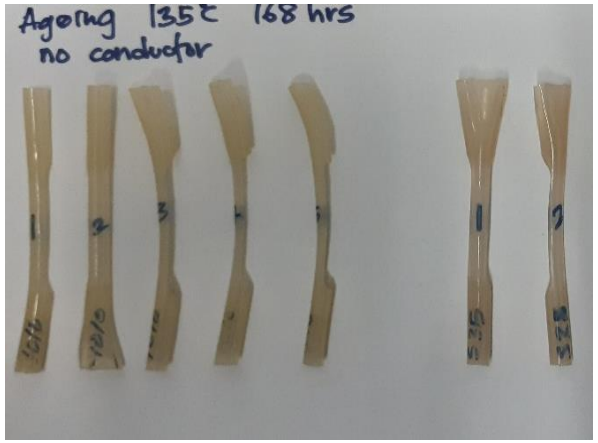
No of turns (6)	No Crack	No Crack	No Crack

6.Oxidative Induction Time (OIT) minutes

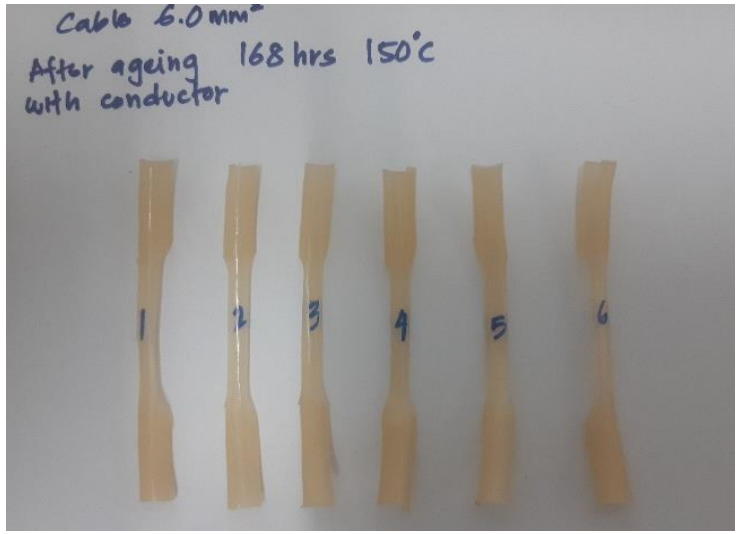
Before Ageing	264	315	315
After ageing with conductor (150°C, 168 hours)	246	257	259



Before Ageing



After Ageing 135°C, 168 hours without conductor



After Ageing 150°C, 168 hours with conductor

Bending Test After Ageing 150°C, 240 hours

XL/HFFR insulation as PVC substitute for internal Wiring

BS EN 50363-5

BRITISH STANDARD

BS EN
50363-5:2005

Insulating, sheathing and covering materials for low voltage energy cables

Part 5: Halogen-free, cross-linked insulating compounds

BS EN 50525-2-3

BS EN 50525-2-31:2011

BSI Standards Publication

Electric cables — Low voltage energy cables of rated voltages up to and including 450/750 V (U_0/U)

Part 2-31: Cables for general applications — Single core non-sheathed cables with thermoplastic PVC insulation

BS EN 50525-3-41

BS EN 50525-3-41:2011

BSI Standards Publication

Electric cables — Low voltage energy cables of rated voltages up to and including 450/750 V (U_0/U)

Part 3-41: Cables with special fire performance — Single core non-sheathed cables with halogen-free crosslinked insulation, and low emission of smoke

An Alternative to PVC Insulation ?

PLEXCHEM Technologies

- An inexpensive crosslinkable compound
- Would be 90˚C rated
- Halogen free
- Low smoke
- Low Acidity
- Colourable (except black)
- Speed up to 300m/min
- Not hazardous in manufacture & disposal
- No plasticisers

NHX	EN 50525-3-41 (H07Z-K)									

Cost of FR-XL is almost the same as PVC , with many safety advantages

With higher copper prices, it preserves the higher current carrying capacity

Using FR-XL provides vantage point for manufacturers committed to quality against ones using rubbish PVC in the market.

Cross-linked Halogen Free compounds

PLEXLINK 2235X-UV
Complying EI 109 & EM 104 EN 50264-1

Grade	Plexlink 2235X-UV			
Description	Crosslinkable, halogen free, low smoke flame retardant.			
Application	Insulation and sheathing compound for cables.			
Material Designation	EN 50264-1 type EI 109 & EM 104			
Properties	Test Method	Unit	Specification	Typical Value
Density	ASTM D 792	g/cm3	-------	Approx. 1.5

Summary of Advantages

- Low cost of equipment (About USD60K)
- Ease of processing and cleaning
- Inexpensive cost of compound with long shelf life
- Low energy consumption. Only 20KW
- No need for extensive modification of production facility
- Extrusion of PE/HFFR thermoplastic with no pre-crosslinking issues
- High draw down = reduced material consumption
- Post production operations could be done immediately
- Processing XL-HFFR cables

Next Phase of Development

- UV protected cables (2.5% carbon black content).

  High concentration of carbon black; blocks UV penetration and requires a special formulation.

Difficult for co-extrusion, if outer semi con is required. Must be extruded in tandem

- Speed adaptation of equipment especially for thin insulation. Our current systems allows for speeds up to 350m/min
- Limitation on high insulation thickness (more than 6 mm)
- Side reactions of photo initiators forms organic by products which are flammable. Reduces effectiveness in HFFR formulations.
- High degree of Crosslink (typical hot set is <40%) reduces elongation values.
- Special colours masterbatches have to be used.
- EPDM insulation (soon).

Safety Requirements

- **Irradiation**. Never look into the beam of a high power LED; the lights very high intensity damage your eyes.
- **Ozone generation**: Short wavelength (,240nm) light may generate ozone from oxygen (however our wavelength is between 350-400nm) and our unit comes with a well ventilated fume system.
- **Lamps**: Most lamps operate at high temperature and at high vapour pressure. Never move or touch lamps during operation.
